

Scenario / Problem Context:

A travel agency offers three holiday packages: Domestic Budget Tours, International Luxury Packages, and Adventure Expeditions.

Each package type has distinct pricing, inclusions (accommodation, transport, meals), insurance requirements, and deposit rules.

Currently, itineraries are typed manually in Word documents and emailed to customers, which is time-consuming and error-prone.

A Python-based booking system is required that accepts customer preferences, computes the total package cost (including taxes and optional add-ons), and generates a personalised itinerary file.

The system must maintain a booking register file and produce daily sales summaries.

Task Description:

Develop a Python application using OOP, file handling, and modules to automate the travel booking workflow.

Package rates, tax rules, and add-on prices must be stored in external configuration files.

Sub-Tasks / Expected Deliverables:

- Define package classes `DomesticBudgetTour`, `InternationalLuxuryPackage`, and `AdventureExpedition` with `compute_total_cost()` methods.
- Implement an add-ons module that reads available extras (travel insurance, airport transfer, guided tour) and their prices from a JSON file.
- Compute the total booking cost including the base package price, selected add-ons, applicable GST (18% on tour packages), and any early-bird discount.
- Generate a personalised itinerary text file for each booking listing day-wise activities, accommodation details, inclusions, and total cost.
- Append each booking to a `booking_register.csv` file; ensure the register is created on first run.
- Produce a daily sales summary report listing total bookings, total revenue, and most popular package type for the day.
